RESEARCH EXPERIENCE

High pressure XMCD studies in the diamond-anvil cell: Developed a high-pressure (1 Mbar), low-temperature (1.4 K), in-field (6.5 Tesla) capability for XANES/XMCD-studies of magnetic materials at high pressures. The instrument features a diamond-anvil cell with perforated anvils to minimize anvil's absorption, remote control of piston-motion via a gas membrane allowing *in-situ* pressure control at low temperatures and an online Ruby fluorescence system for *in-situ* pressure calibration at low temperatures. Studied pressure-induced magnetic transitions in a variety of materials including complex oxides, magneto-caloric materials and transition and rare-earth metals. [*Phys. Rev. Lett.* 109, 027204 (2012); *Phys. Rev. Lett.* 109, 026403 (2012); *Phys. Rev. B.* (Rapid Communications) 84, 100403(R) (2011); *Phys. Rev. Lett.* 100, 045508 (2008); *Phys. Rev. Lett.* 102, 057206 (2009), *High Pressure Research* 28, 185 (2008); *Review of Scientific Instruments* 78, 083904 (2007); *Phys. Rev. B* 76, 014411 (2007)].

X-ray studies of element- and site-specific magnetism in single crystals: Exploited the symmetry properties of crystals in combination with resonant scattering of circularly polarized (CP) x-rays to obtain site-selective magnetic information in single crystals. This technique allowed measuring site-selective magnetization reversals in permanent magnetic materials providing an atomic look at the origins of magneto-crystalline anisotropy in best permanent magnet Nd₂Fe₁₄B [*Phys. Rev. Lett.* 95, 217207 (2005); *IEEE Transactions on Magnetics* 40, 2874 (2004); *Phys. Rev. B* 73, 144416 (2006); *Phys. Rev. B* 74, 104114 (2006); *Appl. Phys. Lett.* 93, 052504 (2008)]. Developed a digital lock-in detection system for dichroic diffraction of CP x-rays (U.S. Patent 7,403,592 issued July 2008).

X-ray studies of interfacial magnetism: Combined x-ray resonant magnetic scattering and magnetic circular dichroism techniques to measure and quantify the spatial extent and strength of magnetic exchange coupling at buried interfaces of layered structures. These techniques revealed the existence of induced Gd magnetization near the Gd/Fe interface and determined its spatial extent. Generalized computer codes were developed to retrieve magnetization density profiles from layered structures within the first Born approximation, and to obtain anomalous magnetic scattering factors from XMCD measurements [*Phys. Rev. Lett.* 87, 207201 (2001); *Physical Review B* 70, 134420 (2004); *Appl. Phys. Lett.* 91, 022503 (2007); *App. Phys. Lett.* 92, 162502 (2008) *Physical Review B* 79, 134438 (2009)].

X-ray studies of inhomogeneous magnetic states in artificial nanostructures: Combined x-ray Magnetic Circular Dichroism (XMCD) with penetration depth tunability of x-rays near the critical angle for total external reflection to probe the nucleation of magnetic twisted phases in Gd/Fe multilayers. This method allowed probing near-surface and bulk magnetic states in a single measurement and revealed the nucleation of a spatially inhomogeneous magnetic state at the surface of an artificial Gd/Fe multilayer [*Phys. Rev. B (Rapid Communications)* 67, 180406(R) (2003); *J. Appl. Phys.* 93, 6507 (2003); *Phys. Rev. B* 73, 174401 (2006)].

XAFS studies of the local structure of high T_c superconductors: Used the orientation dependence of X-ray Absorption Fine Structure (XAFS) in the anisotropic layered structures of high T_c superconductors to measure local atomic arrangements at structural phase transitions and around dopant atoms. Developed methods for preparation of magnetically aligned powders for fluorescence experiments. These measurements revealed, among others, the partial order-disorder nature of the Sr-induced phase transition in La_{2-x}Sr_xCuO₄ [*Phys. Rev. Lett.* 76, 439 (1996)], the polaronic nature of hole carriers doped by Sr in La_{2-x}Sr_xCuO₄ [*Phys. Rev. B (Rapid Communications)* 56, R521 (1997)], the high spin non Jahn-Teller state of Ni in La_{2-x}Sr_xCu_{1-y}Ni_yO₄ [*Phys. Rev. B* 64, 104510 (2001)] and the large local disorder in tilt angle of CuO₆ octahedra present in La_{1.875}Ba_{0.125}CuO₄ [*Phys. Rev. B* 61, 7055 (2000)].

Electron microscopy studies of local atomic structure of materials: Contributed to the development of the EXELFS technique (Extended Energy Loss Fine Structure) as a structural tool with high spatial resolution (50Å -1μm) in the Transmission Electron Microscope (TEM). Main contributions include improvements in data analysis and quantifying the effect of electron radiation damage as a limitation to high spatial resolution [*Micron* **30**, 185-194 (1999), *Ultramicroscopy* **58** n.3-4 p.353 (1995)].

Mössbauer-effect studies of impurities in metals: Used Mössbauer spectroscopy on the ¹¹⁹Sn isotope to study local dynamics and electronic properties of Sn impurities in Ag, Pb and Au metal hosts. Unusually large dynamics of Sn atoms was found at high temperatures, providing new clues into the role of point defects on lowering the melting temperature of dilute binary alloys [*Phys. Rev. B* **47**, 14032 (1993), *J. Phys. Cond. Matt.* **10**, 8573 (1998)].
